## *AEC Critical Review Series*

### **BOILING CRISIS AND CRITICAL HEAT FLUX**

**L. S. Tong**

Westinghouse Electric Corporation

August 1972

The ratio of the predicted critical heat flux (CHF) to the reactor heat flux is used as an index of the power capability of water reactors. Numerous boiling heat-transfer and two-phase-flow studies over the past 15 years have put emphasis on exploring the boiling-crisis mechanisms and on perfecting the CHF predictions. Unfortunately, the problem is more complicated than was thought. Thus far no overall analytical solution has been obtained, and the design equations for CHF predictions are empirical. In this review various types of boiling crisis are categorized according to four major flow patterns: pool boiling, bubbly flow, annular flow, and normal flow across a cylinder. The physical mechanisms of these boiling crises are described. Experimental observations are summarized and used for verifying various analyses. The missing links in the analyses are identified, and future work is recommended.

92 pages, 7 by 9 $\frac{3}{4}$  inches, paperbound

Library of Congress Catalog Card Number: 72-600190

#### **Contents**

##### **Introduction**

##### **Observed Parametric Effects and Empirical Correlations**

- Physical Phenomena Associated with Boiling Crisis
- Local Effects of Pressure, Local Enthalpy, and Mass Velocity
- Upstream Nonuniform Heat-Flux and Flow Memory Effects
- Channel Geometry and Rod-Bundle Effect
- Surface-Condition Effects
- Transient Effects
- Scaling of Boiling Crisis
- Summary of Parametric Effects and Empirical Correlations

##### **Theoretical Analysis**

- Helmholtz Instability of Pool Boiling
- Thermal Balance of Near-Wall Layer in Bubbly Flow
- Mass Balance of Liquid Annulus in Annular Flow
- Hydrodynamic Behavior of Liquid Core in Bubbly Flow
- Liquid-Mass Transfer by Entrainment and Deposition in Annular Flow

##### **Summary and Recommendations**

##### **List of Symbols**

##### **References**
